

THE UNIVERSAL RESEARCH AND INQUIRY METHOD

By Marvin Hunn

Described

Many guides to introductory research recommend approximately the same research procedure. I call it the Universal Research and Inquiry Method (URIM). URIM looks something like the following.

Part One: Define Research Question

1. Select/define an initial topic. This may be narrow or broad, esoteric or mundane, advanced or novice. It should fit your interests and abilities, and meet course requirements or address real world needs.
2. Read at least two reliable summary discussions of your topic. These may be brief treatments such as are typically found in encyclopedias or other reference works. But you may read entire books at this stage.
3. Organize your thinking and formulate a specific research-worthy question about the topic. Write a brief outline to guide your study.

Part Two: Build Bibliography

4. Build an adequate bibliography using databases and specialized tools. Take care to include recent works. Examine the main works you have found and check their bibliographies. Take special care to include much-cited works and diverse viewpoints. Perhaps use software such as EndNote or Zotero to manage and format your citations.
5. If you are a total novice in the field, evaluate credibility of sources and authors based on superficial markers such as reputation of publisher, whether the source is a peer-reviewed journal, etc. Consult book reviews and check scholarly credentials of authors. Later you will do a more careful assessments based on the actual evidence and arguments used in the sources.

Part Three: Read and Think

6. Read, always focusing on the specific research question, but taking time to further educate yourself about the topic in general. Take notes. Document carefully so you do not accidentally plagiarize when you write the first draft. Organize notes.
7. While reading, analyze (i.e., identify and isolate basic arguments and lines of evidence others have used.)
8. While reading, think critically. What is probably true, and why do you think so? This is the heart of the process. Evaluate the evidence and logic and overall argument used by each source. Consult cited primary sources yourself to verify evidence and examine context. Pay attention to both the big picture and the small details as needed.

9. Formulate *tentative* conclusion and thesis statement. Synthesize and organize an argument to support it. Test your argument. Continue to think critically.

Part Four: Write and Think

10. Decide how you want to present the material to a particular audience to support your thesis. This is your rhetorical strategy and it may require creativity in how you frame or present your argument. Do not blindly follow the outline you used to guide your study and note taking about the research question. Do write a new outline which focuses on the thesis.
11. Compose draft. Present the truth as you understand it, being careful to evaluate all significant views fairly. Be logical. Document thoroughly and accurately as you write, not as an afterthought. Continue to think critically.
12. Evaluate your work. Does the draft as a whole hang together and present a coherent argument for the thesis? Does each section advance the goal? Is it persuasive? Remember you are not just summarizing what you read; you are advancing a persuasive case to support a specific conclusion. Rewrite as needed, even if you must reorganize or add new evidence and arguments. Indeed, change your thesis if needed.
13. Edit for cohesion and accuracy. Polish and format.

URIM is based on the literature search model of research. It calls for thoughtful reading, careful understanding of sources, and honest consideration of a wide range of views. Everything is geared to help the researcher interact with scholarly literature and critically evaluate each viewpoint. Often this means weighing conflicting contradictory evidence and, if possible, identifying a viewpoint that reasonably accounts for all evidence. Although URIM involves gathering and sifting information, the goal is not thoughtless collection of footnotes and quotations, or thoughtless regurgitation of what one has read. Information-gathering is a means, not the ends, and judicious, thoughtful, critical assessment of views and evidence is central. Communication is also important. URIM is designed to help the researcher produce a cogent and well documented argument for a specific thesis, including fair assessment of evidence and arguments for and against the thesis.

Evaluated

URIM has some obvious virtues. It is conceptually and practically simple. It provides a starting point and a procedure to follow. It is applicable to a wide range of topics and disciplines. It stresses critical thinking. URIM is a good way to learn about a topic. You have probably followed a procedure much like URIM many times during your academic career.

URIM was designed for undergraduate students. It has a place in graduate studies and it can even be used with profit by mature scholars, but it falls short as a guide for graduate research. Why? What is a better guide to graduate research? We will talk about that in class.
